News Letter

Vol-1, Issue-2 CHALAPATHI INSTITUTE OF PHARMACEUTICAL SCIENCES May-Apr 2011

Rabbani Shaik

III year

CIPS-Chalapathi Institute of Pharmaceutical Sciences, since its inception, has been growing every year by leaps and bounds, both in academics and research activities. Since the initiation of Pharm.D course in the year 2009, Chalapathi Institute of Pharmaceutical Sciences is dedicated to give quality education, as well as adequate clinical exposure to the Pharm.D students.

With the intention of providing hands-on experience to the students in handling of medicines, patient counseling and other healthcare activities, Pharmacy Practice Department of Chalapathi Institute of Pharmaceutical Sciences was inaugurated at Government General Hospital, Guntur. Poison and Drug Information is also started at the Pharmacy Practice Department and it has been running to provide drug and poison related information to the healthcare professionals as well as to the general public. The department has not limited itself to just regular academic activities, but is also actively engaged in enriching the students, staff and healthcare professionals with the updated information about pharmacy education, pharmacy practice in India and abroad, through guest lectures by eminent scholars. The current issue of therapeutic newsletter second encompasses the latest activities of Pharmacy Practice Department.

Academic Events

1. Department of Pharmacy Practice (comprising of lecture halls, Poison and Drug Information Center, library, staff room, patient counseling room and girl's common room) of Chalapathi Institute of Pharmaceutical Sciences was inaugurated by Dr. D. Phani Bhusan, Chief Super indent, GGH at Govt. General Hospital, Guntur.
2. Active participation of students in various academic, learning and training activities at Pharmacy Practice Department has started.
3. II/IV Pharm.D Students have been actively participating in word rounds at GGH, Guntur.

4. Poison and Drug Information Center is started at Pharmacy Practice Department and has been providing poison and drug information services.
5. A certificate program in "Clinical Research, Pharmacovigilance and Regulatory Affairs" is launched on 30th July 2011, to help the PharmD and PG students to abridge the gap between the academics and work environment.
6. Procured "Clinical Pharmacology" software to obtain the latest information about drugs.

Educational Tours

1. II/VI PharmD students of Chalapathi Institute of Pharmaceutical Sciences attended a work shop on "Professionalism in Practice-Through Pharm.D education" held on 09-04-2011, at Anantpur. The students had opportunity to interact with B. Suresh, President, Pharmacy Council of India regarding the purpose and scope of the Pharm.D course. They also had the opportunity to attend various guest lectures delivered by scholars at the workshop.
2. II/IV Pharm.D students also visited the Pharmacy Practice Department of JSS College of Pharmacy, Mysore on 13-04-2011. There they had interacted with the faculty members of the department and got the opportunity to observe the requirements and work flow of a Pharmacy Practice Department.

Guest Lectures

During Apr-Aug 2011, a good number of guest lectures by scholars from within and outside India have been organized to share their knowledge regarding the current status of pharmacy education and profession with the students and staff members. The following is the list of the guest lectures that have been held.

1. Dr. Narendra Vadlamudi, a gastroenterologist practicing in USA addressed the Pharm.D students regarding "Career opportunities for clinical pharmacists and hospital pharmacists in USA" on 17-02-2011.
2. Prof. H. G. Shiv Kumar, Principal, JSS College of Pharmacy, Mysore delivered a guest lecture on "Current status of Pharm.D education and career opportunities in India" on 31st March, 2011.
3. Dr. Premchand, a physician working at GGH, Guntur delivered a lecture to Pharm.D students on "Medicines available at GGH, Guntur" to familiarize students with the medicines that are regularly used at the hospital.
4. Dr. Shanmukha Reddy, Pharmacist at Florida, USA delivered a guest lecture on "Career prospects in USA for Pharm.D and PG students", on 18th July 2011. He explained the students about various stages involved in pursuing a successful career in USA and also about examinations that have to be cleared to work as a registered pharmacist there.
5. Dr. Bhaskara R. Jasti, Professor, University of Pacific, USA, interacted with Pharm.D students of Chalapathi Institute of Pharmaceutical Sciences on 25th July 2011 and delivered a guest lecture on "Career opportunities and the competitive environment for Indian Pharm.D students in USA". He also responded to various questions posed by the students.

Common rainy season diseases, their treatment options and preventive measures

The communicable diseases that are common during the rainy season can be represented as WILD, which stands for Water-borne infectious diseases, Influenza, Leptospirosis and Dengue.

The water-borne diseases are those that are acquired by consumption of contaminated water (or food). They spread widely during the rainy season. They include diarrheal diseases that are caused by several species of the salmonella and shigella bacteria, cholera, hepatitis A, and typhoid fever.

Pharmacy Practice Department of CIPS at GGH, GUNTUR.

Cholera is caused by several serotypes of the *Vibrio cholerae* bacteria. Cholera causes a sudden and profuse diarrhea that leads to dehydration of the patient. It is an easily treatable disease but has to be attended early; otherwise it could even lead to death due to severe dehydration. Adehydration Rehydration is the main objective of cholera treatment. Prompt administration of oral rehydration salts to replace lost fluids nearly always results in cure. If it is more severe, intravenous fluids can be given.

Hepatitis A is an acute infection of the liver that is caused by the hepatitis A virus. Its signs and symptoms include loss of appetite, nausea, vomiting, abdominal pain, fatigue and fever. In severe cases, the skin and the white of the eye become yellow and results in a condition called

as jaundice. Our body will cure itself from the disease and the treatment mainly focuses on reducing the load on the liver-by controlling the diet, restraining from alcohol and avoiding drugs that could damage the liver.

Typhoid fever is caused by *Salmonella typhi* and is characterized by high-grade fever, headache, abdominal pain and diarrhea or constipation. Some of the patients may even develop serious complications like pneumonia, meningitis and infection of the liver and gall bladder, bones, heart valves and kidneys. After the appearance of symptoms, treatment should be started immediately and first line drugs for typhoid fever (in India) are Cefixime for uncomplicated fever, Ceftriaxone or Cefotaxime for complicated fever. If the organism is resistant to the first line drugs, second line drugs like Azithromycin, Aztreonam or Imipenam are to be given.

Influenza or flu is caused by any of the three types (A, B and C) of influenza virus. The flu virus is transmitted by droplets and enters the body through nose or mouth. Flu is characterized by cold-like symptoms plus body pains and headache. It is usually self limiting, but a few people develop life time complications like pneumonia. Immediately after showing symptoms, the patient should take rest, drink lot of liquids, and avoid smoking or alcohol consumption. Medical treatment should also be started with anti-viral drugs like amantidine, rimantidine, zanamivir or oseltamivir.

Drug Information Center of Pharmacy, Practice Department at GGH, Guntur

Leptospirosis is caused by a microorganism that is carried by many domestic and wild animals. Humans usually acquire leptospirosis when they get in contact with water or soil that has been contaminated with the urine of infected animals. Leptospirosis symptoms include high fever, headache, muscle aches especially of the calf, abdominal pain, nausea and vomiting, red eyes, and chills. In its severe form, leptospirosis causes kidney damage, liver and respiratory failure, and meningitis. Treatment options for leptospirosis are doxycycline (in early stages) and penicillin G (drug of choice for hospitalized patients).

Dengue, which by all indications will have a very high incidence rate this year, is a viral disease that is transmitted by the bite of the Aedes mosquito, which breeds in stagnant water. It is characterized by fever and body aches. It is usually self limiting, but sometimes could lead to hemorrhage. Treatment consists of administering pain relievers like paracetamol, acetaminophen (aspirin and brufen are not preferred as they may aggravate hemorrhage), along with rehydration therapy.

WILD diseases can be prevented by the following measures:

1. The most effective way to prevent a communicable disease is through immunization or vaccination. Of the common rainy season diseases, vaccines are available for influenza and hepatitis A. Have yourself immunized with these vaccines, if you haven't done so yet.
2. Avoid exposure to rain and cold weather.
5. Drink only safe water. Drink the boiled and cooled water if necessary.

Dr. D. Phani Bhushan, Inauguration of Pharmacy Practice Department Chief Super, at GGH, GUNTUR

7. Drain stagnant water which is the breeding place of mosquitoes. Ensure that drains and sewage lines are not clogged.
9. Maintain good personal hygiene-this include thorough washing of hands with soap and water especially before eating or touching the eyes and nose with the hands.

Health Tips

1. Overweight people who are on a weight loss diet may be able to reduce their risk of cardiovascular disease and diabetes by eating fatty fish such as salmon, tuna, cod and mackerel every day
2. Relief from cold or a sore throat can be obtained by
 - a. Drinking a cup of milk to which half tea spoon of turmeric and one tea spoon of honey is added, 2-3 times a day.
 - b. Adding tulsi leaves or a small piece of crushed ginger to the tea before drinking.

Drug-Drug interactions

1. Taking caffeine containing drinks (tea and coffee) along with drugs used to treat asthma like aminophylline, theophylline etc. should be avoided, as they both cause stimulation of central nervous system.
2. When codeine is taken (common agent in cough preparations), alcohol should not be consumed as the sedative effect could become severe.

Drug-Food interactions

3. Methenamine, a urinary antiseptic should not be taken with citrus juices or citrus fruits.
4. Consumption of milk should be avoided, when tetracycline antibiotics are taken as it decreases the activity of the drugs.

CHALAPATHI INSTITUTE OF PHARMACEUTICAL SCIENCES

(Affiliated to Acharya Nagarjuna University, Guntur, Approved by A.I.C.T.E., & PCI, New Delhi)

Chalapathinagar, Lam, GUNTUR - 522 034.

Ph : 0863-2524124, 2524125, Fax : 0863-2524123
